

CSE408-Lec#8

- ▶ Dynamic Programming
- ◀ Rod cutting Problem
- ◀ Coin Change problem
- ◀ Knapsack problem

Introduction

- ▶ Dynamic programming is a technique that breaks the problems into sub-problems, and saves the result for future purposes so that we do not need to compute the result again.
- ▶ The sub problems are optimized to optimize the overall solution is known as optimal substructure property.
- ▶ The main use of dynamic programming is to **solve optimization problems.**

Introduction

- ▶ **Let's understand this approach through an example.**
- ▶ Consider an example of the Fibonacci series. The following series is the Fibonacci series:
- ▶ 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, ,...
- ▶ Mathematically, we could write each of the terms using the below formula:
- ▶ $F(n) = F(n-1) + F(n-2),$

Introduction

- ▶ How can we calculate $F(20)$?
- ▶ The $F(20)$ term will be calculated using the n th formula of the Fibonacci series. The below figure shows that how $F(20)$ is calculated.

Introduction

- ▶ How does the dynamic programming approach work?
- ▶ It breaks down the complex problem into simpler sub problems.
- ▶ It finds the optimal solution to these sub-problems.
- ▶ It stores the results of sub problems (memorization). The process of storing the results of sub problems is known as memorization.
- ▶ It reuses them so that same sub-problem is calculated more than once.
- ▶ Finally, calculate the result of the complex problem

Rod cutting

- Suppose you have a rod of length n , and you want to cut up the rod and sell the pieces in a way that maximizes the total amount of money you get. A piece of length i is worth p_i dollars.

length i	1	2	3	4	5	6	7	8	9	10
price p_i	1	5	8	9	10	17	17	20	24	30

- 8 possible ways of cutting the rod of length 4 are.

(a)

(b)

(c)

(d)

(e)

(f)

(g)

(h)

Rod cutting

- ▶ According to the problem, we are provided with a long rod of length n units.
- ▶ We can cut the rod in different sizes and each size has a different cost associated with it i.e., a rod of i units length will have a cost of c_i .

Length	1	2	3	4	5
Price	10	24	30	40	45

v/s length of

Rod Cutting

- ▶ Let's take a case when our rod is 4 units long, then we have the following different ways of cutting it.
- ▶ So, we have to choose between two option for a total of $n-1$ times and thus the total possible number of solutions are

$$\underbrace{2 * 2 * \dots * 2}_{n-1 \text{ times}} = 2^{n-1}.$$

4 unit, not cut = 40

4 unit + 1 unit = 40

2 unit + 2 unit = 48

2 unit + 1 unit + 1 unit = 44

1 unit + 1 unit + 1 unit + 1 unit = 44

Rod Cutting

- For example, by selling the smaller pieces at the optimal price, we are generating maximum profit from the bigger piece. This property is called **optimal substructure**.
- We can say that when making a cut at i unit length, the maximum revenue can be generated by selling the first unit at r_i and the second unit at r_{n-i} .
- The maximum revenue for a rod of length n (r_n) will be the maximum of all these revenues.

$$r_n = \max\{c_n, (r_1 + r_{n-1}), (r_2 + r_{n-2}), \dots, (r_{n-1} + r_1)\}$$

Top Down Code for Rod Cutting

► Example:

length	1	2	3	4	5
weight	1	5	8	9	10

	0	1	2	3	4	5
0	0	0	0	0	0	0
1	0	1	$1+1=2$	$1+2=3$	$1+3=4$	$1+4=5$
2	0	1	5	$1+5=6$	$6+4=10$	$10+1=11$
3	0	1	5	8	$8+1=9$	$8+5=13$
4	0	1	5	8	9	$9+1=10$ $13(\text{max})$
5	0	1	5	8	9	$10+0=10$ $13(\text{max})$

Top Down Code for Rod Cutting

```
► Algorithm:
► For(i =1 to n)
►   for(j=1 to n)
►     if(i<j)
►       rod_cut[i][j]=rod-cut[i-1][j]
►     else
►       rod_cut[i][j]=max(rod_cut[i-1][j],arr[i]+rod_cut[i][j-1])
```

Coin Change Problem | Dynamic Programming

- ▶ In the coin change problem, we are basically provided with coins with different denominations like 1¢, 5¢ and 10¢.
- Now, we have to make an amount by using these coins such that a minimum number of coins are used.
- Let's take a case of making 10¢ using these coins, we can do it in the following ways:
 - ▶ Using 1 coin of 10¢
 - ▶ Using two coins of 5¢
 - ▶ Using one coin of 5¢ and 5 coins of 1¢
 - ▶ Using 10 coins of 1¢

Approach to Solve the Coin Change Problem

- Coin change problem also has the property of the optimal substructure i.e., the optimal solution of a problem incorporates the optimal solution to the subproblems.
- ```
def coinChange(coins, amount):
```
- ```
    dp = [0] * (amount + 1)
```
- ```
 dp[0] = 1
```
- ```
    for coin in coins:
```
- ```
 for j in range(coin, amount + 1):
```
- ```
            dp[j] += dp[j - coin]
```
- ```
 return dp[amount]
```
- ```
# Example usage:
```
- ```
coins = [1, 2, 3]
```
- ```
amount = 4
```
- ```
print("Number of ways to make change:", coinChange(coins, amount))
```

# Approach to Solve the Coin Change Problem

- EXAMPLE 1:
- FIND THE TOTAL NUMBER OF DIFFERENT DENOMINATIONS (1,2,3,) CERTAIN AMOUNT  $W=5$
- $\text{COINS}=\{1,2,3\}$
- $W=\{5\}$
- TOTAL NUMBER OF WAYS=
- (1,1,1,1,1),
- (1,1,1,2),
- (1,2,2),
- (1,1,3),
- (2,3)
- EXAMPLE 2. FIND THE NUMBER

# Approach to Solve the Coin Change Problem

- EXAMPLE 2:

DENOMINATIONS (2,3,5,10) CERTAIN AMOUNT W=15 .

SOLUTION:

1. IF COIN\_VALUE > W, THEN JUST COPY THE ABOVE CELLS

2. EXCLUDE THE COIN ,

3. INCLUDE THE COIN

4. ADD STEP 2 AND 3

|    | 0 | 1 | 2 | 3             | 4             | 5             | 6             | 7             | 8             | 9             | 10            | 11            | 12            | 13            | 14            | 15            |
|----|---|---|---|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|

| 5  | 1 | 1 | 1 | 1             | 1             | 1+<br>1=<br>2 | 2+<br>1=<br>3 | 1+<br>1=<br>2 | 3             | 3             | 4             | 5             | 5             | 5             | 6             | 7             |
| 10 | 1 | 1 | 1 | 1             | 1             | 2             | 3             | 2             | 3             | 3             | 4+            | 5             | 6             | 6             | 7             | 9             |

# Approach to Solve the Coin Change Problem

## ALGORITHM

```
1. a[i][0]=1
2 for(i=0,i<=coin.length,i++)
 for(j=0,j<=amount,j++)
 {
 if(coins[i]>j)
 a[i][j]=a[i-1][j];
 else
 a[i][j]=a[i-1][j] + a[i-1][j-coins[i]];
 }
```

# Knapsack Problem-

- ▶ You are given the following-
- ▶ A knapsack (kind of shoulder bag) with limited weight capacity.
- ▶ Few items each having some weight and value.
- ▶ **The problem states-**
- ▶ Which items should be placed into the knapsack such that-
- ▶ The value or profit obtained by putting the items into the knapsack is maximum.
- ▶ And the weight limit of the knapsack does not exceed.

# Knapsack Problem-

- ▶ Knapsack Problem Variants-
- ▶ Knapsack problem has the following two variants-
- ▶ Fractional Knapsack Problem
- ▶ 0/1 Knapsack Problem

# Knapsack Problem-

- ▶ **Fractional Knapsack Problem Using Greedy Method-**
  - ▶ For each item, compute its value / weight ratio.
    - ▶ Arrange all the items in decreasing order of their value / weight ratio.
- ▶ Start putting the items into the knapsack beginning from the item with the highest ratio.
- ▶ Put as many items as you can into the knapsack

# Knapsack Problem-

## ► Problem-

For the given set of items and knapsack capacity = 60 kg, find the optimal solution for the fractional knapsack problem making use of greedy approach

## ► Step-01:

► Compute the value / weight ratio for each item-

| Items | Weight | Value | Ratio |
|-------|--------|-------|-------|
| 1     | 5      | 30    | 6     |
| 2     | 10     | 40    | 4     |
| 3     | 15     | 45    | 3     |
| 4     | 22     | 77    | 3.5   |
| 5     | 25     | 90    | 3.6   |

| Item | Weight | Value |
|------|--------|-------|
| 1    | 5      | 30    |
| 2    | 10     | 40    |
| 3    | 15     | 45    |
| 4    | 22     | 77    |
| 5    | 25     | 90    |

# Knapsack Problem-

- ▶ Step-02:
- ▶ Sort all the items in decreasing order of their value / weight ratio-

|     |     |       |       |     |
|-----|-----|-------|-------|-----|
| I1  | I2  | I5    | I4    | I3  |
| (6) | (4) | (3.6) | (3.5) | (3) |

- ▶ Step-03:
- ▶ Start filling the knapsack by putting the items into it one by one.

| Knapsack Weight | Items in Knapsack | Cost |
|-----------------|-------------------|------|
| 60              | Ø                 | 0    |
| 55              | I1                | 30   |
| 45              | I1, I2            | 70   |
| 20              | I1, I2, I5        | 160  |

# Knapsack Problem-

Now,

- ▶ Knapsack weight left to be filled is 20 kg but item-4 has a weight of 22 kg.
- ▶ Since in fractional knapsack problem, even the fraction of any item can be taken.
- ▶ So, knapsack will contain the following items-
- ▶  $\langle I_1, I_2, I_5, (20/22) I_4 \rangle$
- ▶ Total cost of the knapsack
- ▶  $= 160 + (20/27) \times 77$
- ▶  $= 160 + 70$
- ▶  $= 230$  units

# Q1

1. Which of the following is/are property/properties of a dynamic programming problem?

- a) Optimal substructure
- b) Overlapping sub problems
- c) Greedy approach
- d) **Both optimal substructure and overlapping sub problems**

## Q2

2. If an optimal solution can be created for a problem by constructing optimal solutions for its subproblems, the problem possesses \_\_\_\_\_ property.

- a) Overlapping subproblems
- b) **Optimal substructure**
- c) Memoization
- d) Greedy

## Q3

3. If a problem can be broken into subproblems which are reused several times, the problem possesses \_\_\_\_\_ property.

- a) **Overlapping subproblems**
- b) Optimal substructure
- c) Memoization
- d) Greedy

## Q4

4. If a problem can be solved by combining optimal solutions to non-overlapping problems, the strategy is called \_\_\_\_\_

- a) Dynamic programming
- b) Greedy
- c) **Divide and conquer**
- d) Recursion

## Q5

5. When dynamic programming is applied to a problem, it takes far less time as compared to other methods that don't take advantage of overlapping subproblems.

**a) True**

b) False

## Q6

6. In dynamic programming, the technique of storing the previously calculated values is called

---

- a) Saving value property
- b) Storing value property
- c) **Memorization**
- d) Mapping

7. Which of the following problems is NOT solved using dynamic programming?

- a) 0/1 knapsack problem
- b) Matrix chain multiplication problem
- c) Edit distance problem
- d) Fractional knapsack problem**

8. Which of the following techniques can be used to solve the Rod Cutting Problem efficiently?

- a) Greedy algorithm
- b) Depth-first search
- c) Breadth-first search
- d) Memoization(DP)**

9. What is memoization in the context of dynamic programming?

**A technique for storing the results of expensive function calls and reusing them later.**

b) A technique for solving problems by breaking them down into smaller subproblems and solving each subproblem only once.

c) A technique for optimizing recursive algorithms by storing intermediate results in a table.

d) A technique for minimizing memory usage in algorithms by storing only essential information.

10. What is the time complexity of solving the Rod Cutting Problem using memoization?

a)  $O(n)$

b)  $O(n \log n)$

**c)  $O(n^2)$**

d)  $O(2^n)$

11. Which data structure is commonly used in memoization for the Rod Cutting Problem?

a) **An array or a hash table**

b) A linked list

c) A stack

d) A queue

12. What is the space complexity of the memoized solution to the Rod Cutting Problem?

a)  **$O(n)$**

b)  $O(1)$

c)  $O(\log n)$

d)  $O(n^2)$
